

Call Analysis - what the business gets from each release

Release	Business outcome	What business users receive	Completion signal
R0 Groundwork <i>Internal</i>	Nothing visible to the business yet. The data structures are built and the first list of call categories and subcategories is agreed with the call center leads. Everything built afterwards adds to this base rather than reworking it.	A category and subcategory list to review and sign off.	The call center has signed off the first category list and the tables are in place.
R1 Every call categorized <i>First value</i>	Every call is broken into the topics discussed (for example crown coverage, then finding a dentist) and each topic is given a category and subcategory. Results are stored with our own data, not locked in Genesys, and reports come out of the system instead of being compiled by hand. No detail below subcategory yet.	- A report for any group, payer or caller type: number and share of calls by category and subcategory, for any period. - The CareSource Ohio PCIR and PCDR reports produced by the system each month. - A record of which category version was used for any call.	Every incoming call is categorized automatically and the manual CareSource reporting stops.
R2 Actionable detail and a dashboard <i>Main payoff</i>	Knowing that half of calls are about benefits is not enough to act on. This release captures the specifics behind each subcategory: which procedure code; whether the caller asked about coverage, the maximum or the deductible; whether the dentist list was emailed or read over the phone; whether the toolkit problem was a password or an MFA code. The data opens up in an interactive dashboard.	- An interactive dashboard: last 30, 60 or 90 days, filtered by caller type, group or program, top categories by volume, drill-down into the specifics of a subcategory. - The same data available to Power BI or Tableau for building your own views.	The call center confirms the detail is specific enough to act on for benefits and eligibility, provider search and toolkit.
R3 The system learns, the business decides <i>Growth</i>	The system reviews what members and providers have been asking and proposes categories and subcategories that are not yet in the list. The business approves or rejects each proposal; approved changes apply to new calls from that point without a feature-team request. Trends over time appear on the dashboard, and chatbot conversations join the analysis.	- Proposed category updates to approve or reject. - Period-over-period comparison on the dashboard, overall or for one group. - Chatbot sessions categorized, with whether the bot fulfilled the request.	A category proposed by the system has been approved by the business and is in use for new calls.
R4 Ask anything <i>Exploration</i>	Instead of waiting for a report, ask the question directly, and surface questions nobody thought to ask.	- A plain-language question interface over the data ("what were GM members calling about last month?"). - Keyword search over a time window (mentions of a mailer since it went out). - Wrong-queue and other-plan call counts.	A call center manager answers a question nobody planned for, without asking IT.
